When used at much lower doses in an off-label protocol referred to as low dose naltrexone (LDN), the drug has been shown to halt disease progression in Crohn's disease and certain cancers, to reduce symptoms in multiple sclerosis and autism, and to improve numerous autoimmune and neurodegenerative conditions, including Parkinson's disease and amyotrophic lateral ...

The Promise of Low Dose Naltrexone Therapy: Potential ...

One downside of LDN is that there's not a standardized dose, and the most effective dose for a given patient may be anywhere from 1.25 to 4.5 milligrams. We typically start patients on 1 to 1.5 milligrams, then gradually increase to 4.5 milligrams and see how they do. From my experience, I've seen most people end up around 2.5 to 3 milligrams.
